List of Reports and Publications for Ecological Reserves in British Columbia

Introduction

Ecological reserves are created not only to conserve representative and/or unique ecosystems of British Columbia, but to offer **long-term research** and **educational opportunities**. Since 1971 when the first ecological reserves were created in British Columbia, a substantial number of research projects have been completed in our reserves, including numerous graduate thesis projects, long-term monitoring or ecological studies, as well as short-term projects.

Since our first list of Reports and Publications was released in 1986, at least 603 new listings have been added, for a total of 1054 titles. Some of the listings added were dated, being passed onto us by researchers who were just becoming aware of the existence of our publication. This year 134 new references are listed for 1990. Again, we would appreciate receiving any additional references which you feel are pertinent.

References with a full number (i.e. 4, or 52-17) are filed in our office. We are attempting to obtain copies of those references with a parenthesis in their report number (i.e. 52-(28)). References not given a number were included as pertinent as they could be useful to researchers planning to work in a reserve; however, we will not be obtaining copies of these reports.

The B.C. ecological reserves system now contains 131 reserves covering an area of 159,751 hectares. We hope that this list of reports and publications will prove useful to researchers in this province and elsewhere.
